Hello professor, I am making this readme file because I used a different method to make each part of my website for the HTML, CSS and Javascript, mainly coding it on sublime, hopefully that is okay since I know we learned to make them through codepen. But, basically to test out my code after you extract the zip file all you need to do is go into the code folder and drag the 'PMatch1.html' file onto a new tab on your browser and from there it should be open the homepage and then you can click the navbar or the 'get started' button to open all other following pages.

All files should have the same name when it comes to the HTML file, CSS file and JS file except for the home page which uses the following: PMatch1.html , MatchApp.css and test.js. Then there is a file called DogSelector.js which is used in the result page and questions page to return a key which should match to a corresponding key in Dogs[key]. There are a few bugs when it comes to the questions page and how you click the buttons but if there was a mistake made then the page will alert you if you click the 'get my results' button then to reset all you have to do is click the reset button on the right of the result button.

Finally the biggest bug that I know of as of now is if you try to open these files on your mobile device browser it won't work so hopefully you don't do that! But yeah this took a lot more time than I expected even though it has minimal design but I am happy with the results!
